EP 1 004 241 A1

Description

BACKGROUND OF THE INVENTION

5 [0001] Insect and acarid pests destroy growing and harvested crops. In the United States, agronomic crops must compete with thousands of those pests. In particular, tobacco budworms and southern armyworms are especially devastating to crops.

[0002] Tobacco budworms -cause tremendous economic losses in agronomic crops. In particular, budworms devastate cotton crops by feeding on green bolls. Control of budworms is complicated by their resistance to many common
10 insecticides, including organophosphates, carbamates and pyrethroids.

[0003] In spite of the commercial insecticides and acaricides available today, damage to crops, both growing and harvested, caused by insect and acarid pests still occurs. Accordingly, there is ongoing research to create new and more effective insecticidal and acaricidal agents.

[0004] Certain N-carbamoyl-3-carboxyaryl-heterocyclic and hydrazinecarboximidamidohydrazone compounds which are useful as herbicidal agents are described in U.S. 5,670,456. However, that patent does not describe any
15 insecticidal or acaricidal activity.

[0005] Certain cyclic 1,3,4-oxadiazoline compounds are described by D. Kochetov et al in Ukrainskii Khimicheskii Zhurnal, 57(2), pp. 215-217 (1991). However, D. Kochetov et al do not disclose any utility for their cyclic 1,3,4-oxadiazoline compounds

20 [0006] It is, therefore, an object of the present invention to provide compounds which are useful for the control of insect and acarid pests.

[0007] It is also an object of the present invention to provide a method for the control of insect and acarid pests.

[0008] It is a further object of this invention to provide a method for the protection of growing and harvested crops from damage caused by insect and acarid attack and infestation.

25 [0009] These and other objects of the present invention will become more apparent from the description thereof set forth below.

SUMMARY OF THE INVENTION

30 [0010] The present invention comprises 2-aryl- Δ^2 -1,3,4-(oxa and thia)diazoline compounds which are useful for the control of insect and acarid pests. Those compounds are also useful for protecting plants from damage caused by insect and acarid attack and infestation.

[0011] The pesticidal 2-aryl- Δ^2 -1,3,4-(oxa and thia)-diazoline compounds of the present invention have the structural formula I

[0033]

[0034] A solution of *m*-trifluoromethylbenzoyl hydrazine (1.84 g) and acetone (40 mL) is refluxed for 48 hours, cooled to room temperature and concentrated *in vacuo* to obtain a colorless hydrazone (1.48 g, m.p. 100-103°C). A solution of the hydrazone (0.74 g), *p*-trifluoromethoxyphenylisocyanate (0.62 g), and 1,2-dichloroethane (15 mL) is refluxed for 16 hours, cooled to room temperature, and concentrated *in vacuo* to give the title product as a colorless solid (1.28 g, m.p. 120-122°C).

[0035] Using essentially the same procedure as described for the preparation of Example 1, but using the appropriately substituted hydrazine, ketone and isocyanate, the following compounds are obtained:

EXAMPLE 166**Preparation of 2-(*p*-Chlorophenyl)-5-methyl-5-trifluoromethyl-4'-(trifluoromethyl)- Δ^2 -1,3,4-oxadiazoline-4-carboxanilide**

[0036]

[0037] A mixture of *p*-chlorobenzoyl hydrazine (1.77 g), 1-trifluoromethyl-1-acetoxyethylene (1.78 g) and ethanol (35 mL) is refluxed for 17 hours, cooled to room temperature, and concentrated *in vacuo* to obtain the corresponding benzoyl hydrazone (0.71 g). A mixture of the hydrazone (0.8 g) and 1,2-dichloroethane (10 mL) is treated with a *p*-trifluoromethylphenylisocyanate (0.67 g), heated at reflux for 87 hours, and concentrated *in vacuo* to obtain a colorless solid (1.48 g). Flash chromatography of the solid on silica gel (25% CH₂Cl₂/hexanes to 50% CH₂Cl₂/hexanes) gives the title product as a colorless solid (0.16 g, m.p. 157-158°C).

[0038] Using essentially the same procedure as described for Example 166, but using the appropriately substituted hydrazine and isocyanate, the following compounds are obtained.

Example	R	R ₄	mp °C
167	Cl	OCF ₃	128-129

EXAMPLE 170**Preparation of *p*-chlorobenzoylthiohydrazide**

[0039]

[0040] A solution of carbon disulfide (4.5 mL, 75 mmol) and tetrahydrofuran (50 mL) is cooled to 0°C, treated dropwise with a solution *p*-chlorophenylmagnesium bromide (50 mL of 1M solution) at a rate that maintains the temperature below 10°C, warmed to and stirred at room temperature for 2 hours, concentrated *in vacuo* and diluted with water. The resultant aqueous mixture is filtered through diatomaceous earth. The filtrate is treated with a solution of chloroacetic acid (5.67 g), sodium hydrogen carbonate (3.82 g) and water (24 mL), stirred for three days at room temperature, acidified to pH 1 with 50% aqueous sulfuric acid and filtered to obtain the thioester (8.98 g). To a cold (0°C) solution of the thioester (3.5 g), sodium hydroxide (0.58 g) and water (35 mL) is added hydrazine hydrate (1.4 g). During the addition, the color changes from red to yellow and a solid precipitates. The solid is collected, washed with water, and dried to give the title product (1.92 g, m.p. 112-114°C).

EXAMPLE 171**Preparation of 2-(*p*-chlorophenyl)-5,5-dimethyl- Δ^2 -1,3,4-thiadiazoline**

[0041]

[0042] A solution of *p*-chlorobenzoylthiohydrazine (1.02 g), acetone (1.89 g) and ethanol (5 mL) is stirred at room temperature for 4 days and the solvents are evaporated to obtain a brown solid. Flash chromatography of the brown solid on silica gel (10% ethyl acetate/hexanes) gives the title product as a yellow solid (0.44 g, m.p. 51-53°C).

EXAMPLE 172**Preparation of 2-(*p*-Chlorophenyl)-5,5-dimethyl-4'-(trifluoromethyl)- Δ^2 -1,3,4-thiadiazoline-4-carboxanilide**

[0043]

[0044] A solution of 2-(*p*-chlorophenyl)-5,5-dimethyl- Δ^2 -1,3,4-thiadiazoline (0.33 g) and 1,2-dichloroethane (8 mL)

is treated with *p*-trifluoromethylphenylisocyanate (0.30 g), stirred for 72 hours at room temperature, and concentrated *in vacuo* to obtain a solid. Flash chromatography of the solid on silica gel (30% methylene chloride/hexanes) gives the title product as a colorless solid (0.61 g, m.p. 129-131°C).

[0045] Using essentially the same procedure as described for Example 172, but using the appropriately substituted isocyanate, the following compound is obtained:

Example 173 mp 102-103°C

EXAMPLE 174

Preparation of 1-Oxide-2-(*p*-chlorophenyl)-5,5-dimethyl-4'-(trifluoromethoxy)- Δ^2 -1,3,4-thiadiazoline-4-carboxanilide

[0046]

[0047] A solution of 2-(*p*-chlorophenyl)-5,5-dimethyl-4'-(trifluoromethoxy)- Δ^2 -1,3,4-thiadiazoline-4-carboxanilide (0.50 g) and dichloromethane (15 mL) is stirred at -5°C, treated with 3-chloroperoxybenzoic acid (0.30 g, 70%), stirred

for 3.5 hours at room temperature, and diluted with dichloromethane (10 mL). The resultant mixture is washed with 5% sodium carbonate solution, dried over anhydrous magnesium sulfate, concentrated to 10 mL volume, and cooled in a refrigerator overnight. The white precipitate is filtered and dried to give the title product as a colorless solid (0.49 g, m.p. 214-215°C).

EXAMPLE 175

Preparation of 1,1-Dioxide-2-(p-chlorophenyl)-5,5-dimethyl-4'-(trifluoromethoxy)- Δ^2 -1,3,4-thiadiazoline-4-carboxanilide

[0048]

[0049] A solution of 2-(p-chlorophenyl)-5,5-dimethyl-4'-(trifluoromethoxy)- Δ^2 -1,3,4-thiadiazoline-4-carboxanilide (0.50 g) and dichloromethane (15 mL) is stirred at -5°C, treated with 3-chloroperoxybenzoic acid (1.79 g, 70%), stirred for 18 hours at room temperature, treated with additional 3-chloroperoxybenzoic acid (0.12 g, 70%), stirred for 14 hours at room temperature, washed with 5% sodium carbonate solution, dried over anhydrous magnesium sulfate, and concentrated *in vacuo* to obtain a solid. Flash chromatography of the solid on silica gel using a 10% ethyl acetate in hexanes solution gives the title product as a colorless solid (0.42 g, m.p. 181°C).

EXAMPLE 176

Insecticidal and acaricidal evaluation of test compounds

[0050] Test solutions are prepared by dissolving the test compound in a 35% acetone in water mixture to give a concentration of 10,000 ppm. Subsequent dilutions are made with water as needed.

Spodoptera eridania, 2nd instar larvae, southern armyworm (SAW)

5 [0051] A Sieva lima bean leaf expanded to 7-8 cm in length is dipped in the test solution with agitation for 3 seconds and allowed to dry in a hood. The leaf is then placed in a 100 x 10 mm petri dish containing a damp filter paper on the bottom and ten 2nd instar caterpillars. At 5 days, observations are made of mortality, reduced feeding, or any interference with normal molting.

Diabrotica virgifera virgifera Leconte, 2nd instar western corn rootworm (WCR)

10 [0052] One cc of fine talc is placed in a 30 mL wide-mouth screw-top glass jar. One mL of the appropriate acetone test solution is pipetted onto the talc so as to provide 1.25 mg of active ingredient per jar. The jars are set under a gentle air flow until the acetone is evaporated. The dried talc is loosened, 1 cc of millet seed is added to serve as food for the insects and 25 mL of moist soil is added to each jar. The jar is capped and the contents thoroughly mixed mechanically. Following this, ten 2nd instar rootworms are added to each jar and the jars are loosely capped to allow
15 air exchange for the larvae. The treatments are held for 5 days when mortality counts are made. Missing larvae are presumed dead, since they decompose rapidly and cannot be found. The concentrations of active ingredient used in this test correspond approximately to 50 kg/ha.

Tetranychus urticae (OP-resistant strain), 2-spotted spider mite (TSM)

20 [0053] Sieva lima bean plants with primary leaves expanded to 7-8 cm are selected and cut back to one plant per pot. A small piece is cut from an infested leaf taken from the main colony and placed on each leaf of the test plants. This is done about 2 hours before treatment to allow the mites to move over to the test plant to lay eggs. The size of the cut, infested leaf is varied to obtain about 100 mites per leaf. At the time of test treatment, the piece of leaf used
25 to transfer the mites is removed and discarded. The newly-infested plants are dipped in the test solution for 3 seconds with agitation and set in the hood to dry. After 2 days, one leaf is removed and mortality counts are made.

Aphis gossypii, cotton aphid (CA)

30 [0054] Cotton plants at the cotyledon stage are selected and cut back to one plant per pot. A heavily infested leaf is taken from the main colony and placed on top of each cotyledon. The aphids are allowed to transfer to the host plant overnight. At the time of test treatment, the leaf used to transfer the aphids is removed and discarded. The cotyledons are dipped in the test solution and allowed to dry. After 5 days, mortality counts are made.

Diabrotica undecimpunctata howardi, eggs-southern corn rootworm (SCR-Eggs)

35 [0055] Wells containing artificial diet are treated with the test solutions and dried. Southern corn rootworm eggs are then placed in the wells. The wells are covered with vented, adhesive, clear plastic covers. After 7 days, mortality counts are made.

40

Heliothis virescens, 3rd instar tobacco budworm (TBW)

45 [0056] Cotton cotyledons are dipped in the test solution and allowed to dry in a hood. When dry, each is cut into quarters and ten sections are placed individually in 30 mL plastic medicine cups containing a 5 to 7 mm long piece of damp dental wick. One 3rd instar caterpillar is added to each cup and a cardboard lid placed on the cup. Treatments are maintained for 3 days before mortality counts and estimates of reduction in feeding damage are made.

[0057] The tests are rated according to the scale shown below and the data obtained are shown in Table I.
